The genome sequence of the probiotic intestinal bacterium
Lactobacillus johnsonii NCC 533 ";
Proc. Natl. Acad. Sci. U.S.A. 101:2512-2517(2004).

I. FUNCTION: Catalyzes the cleavage of the glycosidic bond of 2'-
Cecxyribonucleosides and the transfer of the deoxyribosyl moiety
to an acceptor purine or pyrimidine base (By similarity).

C. -CATALYTIC ACTIVITY: 2-deoxy-D-ribosyl-base(1) + base(2) = 2-deoxy-
D-ribosyl-base(2) + base(1).

D-ribosyl-base(2) + base(1).

C. -- SIMILARITY: Belongs to the nucleoside deoxyribosyltransferase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           396

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Submitted (NOV-2001) to the EMBL/GenBank/DDBJ databases.

-1- FUNCTION: Catalyzes the cleavage of the glycosidic bond of 2'-
deoxyribonucleosides and the transfer of the deoxyribonsyl moiety
to an acceptor purine or pyrimidine base (By similarity).

-1- CATALYTIC ACTIVITY: 2-deoxy-D-ribosyl-base(1) + base(2) = 2-deoxy-
D-ribosyl-base(2) + base(1).

-1- PATHWAY: Nucleotide metabolism.
-1- SIMILARITY: Belongs to the nucleoside deoxyribosyltransferase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ileTyrLeuAlaThrSerPhePheAsnGluGluGlnArgAlaArgIleProGlnAlaLeu

## ALIGNMENTS

```
The present sequence represents a nucleoside 2-deoxyribosyltransferase enzyme. This enzyme is involved in the biosynthesis of deoxyribonucleosides, and is used in the method of the invention. The specification describes a method for the in vitro enzymatic synthesis of deoxyribonucleosides. The method comprises reacting deoxyribose 1-phosphate and a nucleobase to form a deoxyribonucleoside and an inorganic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          In vitro enzymatic synthesis of deoxyribonucleosides comprises reacting deoxyribose 1-phosphate and a nucleobase to form a deoxyribonucleoside and an inorganic phosphate.

The enzyme is encoded by the ntd gene. The N-deoxyribosyltransferase protein is useful to raise specific antibodies, and for in vitro or in vivo enzymatic synthesis of deoxyribonucleotides, particularly those containing non-natural bases. These deoxyribonucleotides are useful for treating bacterial, viral (e.g. HIV), paramitic or fungal infections, for antitumour chemotherapy, and as insecticides or herbicides
                                                                                                                                                                                                                                                                                                                                                                     61 DKVWATATYNNDLNGIKTNDIMLGVYIPDEEDVGLGMELGYALSQGKYVLLVIPDEDYGK 120
                                                                                                                                                                                                                                                                                                                                                    DKVWATATYNNDLNGIKTNDIMLGVYIPDEEDVGLGMELGYALSQGKYVLLVIPDEDYGK 120
             dideoxyribosyltransferase (DDTP), i.e. an eizyme able to transfer dideoxyribose from one dideoxyribonucleotide to another. Such an enzyme is used for preparation of nucleotides and nucleosides that have antitumour activity or can be used to treat infections, particularly ddc and ddl. The current sequence represents the N-deoxyribosyltransferase (DTP) amino acid sequence containing a G9S mutation. This protein displays the activity of N-dideoxyribosyltransferase.
                                                                                                                                                                                                                                                                                                                09

The invention relates to a method for evolution of a protein (X) so a modify its characteristics. Further disclosed are mutated proteins (X: produced by the new method and with altered activity, relative to (X) Also disclosed is a nucleic acid (I) comprising a sequence for N-dideoxyribosyltransferase (DDTP), obtained from an N-deoxyribosyltransferase (DDTP), using the new method. The method is

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence represents a N-deoxyribosyltransferase protein from Lactobacillus. The enzyme is encoded by the ntd gene. The N-deoxyribosyltransferase protein is useful to raise specific antibodies, and for in vitro or in vivo enzymatic synthesis of deoxyribonucleotides, particularly those containing non-natural bases. These deoxyribonucleotides are useful for treating bacterial, viral (e.g. HIV), parasitic or fungal infections, for antitumour chemotherapy, and as insecticides or herbicides

The nucleoside deoxyribosyltransferase-II and the encoding gene are useful in an enzymatic preparation of a deoxynucleoside. The deoxynucleoside is useful as the raw material for various drugs. The present sequence represents the L. helveticus recombinant nucleoside deoxyribosyltransferase-II (ndt8)

The present sequence represents a N-deoxyribosyltransferase protein from lactobacillus. The enzyme is encoded by the ntd gene. The N-deoxyribosyltransferase protein is useful to raise specific antibodies, and for in vitro or in vivo enzymatic synthesis of deoxyribonucleotides, particularly those containing non-natural bases. These deoxyribonucleotides are useful for treating bacterial, viral (e.g. HIV), parasitic or fungal infections, for antitumour chemotherapy, and as insecticides or herbicides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              45 NQYKGIRVDEHPEYLHDKVWATATYNNDLNGIKTNDIMLGVYIPDEEDVGLGMELGYALS 104

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence rewpresents a N-deoxyribosyltransferase protein from Lactobacillus. The enzyme is encoded by the ntd gene. The N-deoxyribosyltransferase protein is useful to raise specific antibodies, and for in vitro or in vivo enzymatic synthesis of deoxyribonucleotides, particularly those containing non-natural bases. These deoxyribonucleotides are useful for treating bacterial, viral (e.g. HIV), parasitic or fungal infections, for antitumour chemotherapy, and as insecticides or herbicides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         61 VYLPEEEDVGLGMELGYALSQGKYILLVIPDEDYGKPINLMSWGVCDNVIKISELKDFDF 120

                                                                                                                                                                                           The present sequence represents a N-deoxyribosyltransferase protein from lactobacillus. The enzyme is encoded by the ntd gene. The N-deoxyribosyltransferase protein is useful to raise specific antibodies, and for in vitro or in vivo enzymatic synthesis of deoxyribonucleotides, particularly those containing non-natural bases. These deoxyribonucleotides are useful for treating bacterial, viral (e.g. HIV), parastic or fungal infections, for antitumour chemotherapy, and as insecticides or herbicides
                                                                                                                                                                                                                                                                                                                                                                                                                                      69
                                                                                                          New N-deoxyribosyltransferase from Lactobacillus, useful for preparing deoxyribonucleotides, e.g. for use as antiviral agents, also related nucleic acid and antibodies.

The present invention is related to a Lactococcus lactis nucleotide sequence (ABA30521) and related proteins (ABB3300-ABB55621). The nucleic acid sequence is useful in the detection and/or amplification of nucleic acid sequence, particularly to identify Lactococcus lactis or related species. The proteins of the invention are useful for the biosynthesis or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents a N-deoxyribosyltransferase protein from Lactobacillus. The enzyme is encoded by the ptd gene. The N-deoxyribosyltransferase protein is useful to raise specific antibodies, and for in vitro or in vivo enzymatic synthesis of deoxyribonuclectides, particularly those containing non-natural bases. These deoxyribonuclectides are useful for treating bacterial, viral (e.g. HIV), parasitic or fungal infections, for antitumour chemotherapy, and as insecticides or herbicides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  58

or in vivo. The vector is useful for the delivery and expression of biologically useful proteins in gene therapy protocols, and for delivering large DNA segments for engineering of vertebrate cells. Polymucleotides of the invention have applications in techniques such as their use as insertion sites for foreign genes of interest, hybridisation probes, for chromosome and gene mapphing, in PCR technologies, and in the production of sense or antisense nucleic acids. Vectors of the invention provide for stable integration and expression of heterologous DNA in host cells, and are adapted for accepting large heterologous polymucleotide inserts which can be delivered in an infected or transformed cell and expressed in a stable fraction. The current sequence represents an amsacta moorei entomopoxvirus (AmEPV) P4a core protein (AMV139)

The invention relates to a recombinant entomopox virus (BPV) vector, comprising a polymucleotide encoding a protein operably linked with a heterologous promoter sequence. The invention also concerns methods for providing gene therapy for genetic deficiency disorders. Vectors of the invention are useful for delivering a polymucleotide encoding a protein call. The vector is introduced into the vertebrate cell preferably amammalian call, such as a human call. The vector is introduced into the vertebrate cell by infection in a viral particle, or by transfection, transduction, or injection either in vitro

Novel recombinant entomopox virus vector useful for delivering polynucleotide encoding protein to vertebrate cell, comprises polynucleotide encoding protein operably linked with heterologous

Also included are a recombinant vector comprising the nucleic acid operably linked to transcription regulatory element, a cell comprising the vector and a single-stranded probe comprising the nucleic acid. The nucleic acid are chosen from 3654 disclosed sequences encoding 3654 disclosed proteins. The nucleic acids is useful for diagnosing pathological conditions resulting from E. faccium bacterial infection (e.g. urinary tract infection, bacteraemia, endocarditis, wounds and abdominal-pelvic infection) and for screening drugs such as agonists and antagonists. The

The method is useful for identifying an immunogenic protein or its fragment capable of eliciting an immune response in a subject. The method is useful for treating an autoimmune condition (e.g. rheumatoid arthritis or multiple sclerosis), cystic fibrosis, acute pulmonary exacerbation, infection (e.g. P. aeruginosa) and cancer. The method is useful for identifying a marker of a condition or in diagnosis of a condition such as disease or disorder e.g., infectious disease. Cancer, or autoimmune disease. In the method, the protein or peptide fragment are sulficiently non-degraded to permit determination of their amino acid sequences. The
nucleic acid is useful for recombinant production of Candida albicans derived peptides or antisense polypeptides. Pharmaceutical compositions and vaccinies contraining the nucleic acid are useful for preventing or treating Enterococcus faccium infections. The present sequence represents one if the disclosed E. faccium proteins.
                                                                                                                                                                                                                                                                                                                                           121
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Identifying immunogenic protein useful as antigen in vaccine composition, involves obtaining protein complex comprising immunoglobulin or immunoglobulin-containing fraction from subject and identifying protein

The nucleic acid sequence is useful in the detection and/or amplification of nucleic acid sequence, particularly to identify Lactococcus lactis or related species. The proteins of the invention are useful for the biosynthesis or biodegradation of a composition of interest. The invention helps research in lactic bacteria, particularly useful in the production of yogurt and cheese. Note: The sequence data for this patent is based on equivalent patent WO200177334 (published 18-OCT-2001) which is available in electronic format directly from WIPO at the patent of 29-AUG-2003 to standardise OS field)
                                                                                                                                                        YLHDKVWATATYNNDL----NGIKTNDIML---GVYIPDEEDVGLGMELGYALSQGKYV 109
                                                                                                                                      57
                                                                                                        Gaps
present sequence represents the amino acid sequence of the {\mathbb F}. magna antibody light chain binding protein, protein {\mathbb L}.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New nucleotide sequence useful in the identification or Lactococcus lactis and related species.
                                                                                                        28;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 7, A Sequence 18, Sequence 1800
